

Jet Foam Cannon Instructions

1/ Partially undo the four bolts on the fan base

2/ Locate the foam head onto the base and tighten the bolts

3/ Attach the white hose to the head

4/ Attach the red and white hoses to the pump

5/ Plug the blue and white plugs into the base

6/ Prime the pump by connecting a hose, opening the silver tap and filling the pump. This only takes a few seconds. You don't have to fill the pipes.

The white plug connects to the pump.
The blue plug connects to the mains.
Make sure the power switch on the pump is on.

7/ Close the silver tap and remove the hose.

8/ Fill the blue barrel using 4 litres of foam fluid to a full barrel of tap water. Make sure the hose is below the water level to ensure that it doesn't foam up during filling. If you are in a hard water area, you may need up to 5 litres of concentrate to one barrel.

9/ Put the end of the red hose in the barrel, ensuring it sits at the bottom.

10/ Fit the metal tank to the base unit and fill with water. This acts as a counterbalance when you lower the head.

11/ When ready, push the minus button on the control panel and hold for 1 second. The fan will start, shortly followed by the pump.

12/ To stop the foam, press the minus button again for 1 second.

13/ Don't let the pump run dry. It will damage the pump and you will need to re-prime it.
